

Price options scenarios

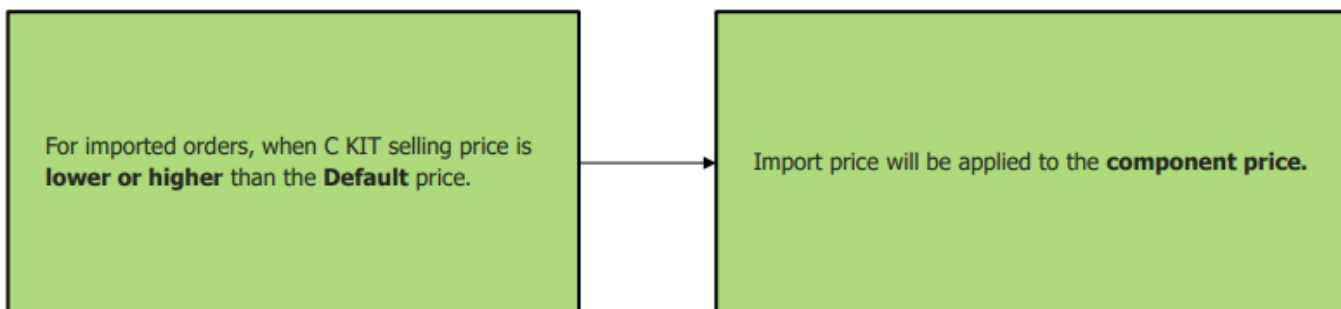

Scenario # 1

Scenario # 2

Scenario # 3

Scenario # 4

When **Variance Quantity** is applied for one of the components.

Any additional quantity added to any of the variance components will sum up the price for that component.

KIT Default Price : \$1000

- Component A ($\$950 - \$150 \dots 1000 - ?$) = $1000 * 150 / 950 = \$157.89$
- Component B ($\$950 - \$400 \dots \$1000 - ?$) = $\$1000 * \$400 / \$950 = \421.05
- Component C ($\$950 - \$400 \dots 1000 - ?$) = $\$1000 * \$400 / \$950 = \$421.06 +$
(Variance added 1 quantity $1X\$200 = \200) = $\$621.06$

Here the price of the C KIT is \$1200, as one of the component has variance of 1 additional quantity.
