

POS

Menu: Manage POS / POS Settings

Feature: POS

Editions: Corporate, Store

These settings control the integration with the Fusion POS. The options are:

- Register
 - The POS register definition that Fusion POS should use when saving sales and other transactions.
- This register definition should be created in the POS admin tools.
 - **Important:** the register should be for the exclusive usage by Fusion POS.
- It's important to ensure that the register definition is created properly. Fusion POS will use the register definition for:
 - Location and Store settings
 - Customer template to use when creating new customers
 - Default transaction class for any orders created through POS (e.g. checkout)
- Default Clerk
 - The POS user (or clerk) account to use when saving sales and other transactions.
 - Fusion POS does not use or observe register security settings; this field's purpose is for POS to supply a valid user in transaction records.
- Default Customer
 - The POS customer account to use when saving sales and other transactions, when a

customer context is not known (e.g. a 'guest' customer is placing an order, or a salesperson is creating an order for a guest customer).

- This customer account should be created in the POS admin tools and Sage, if applicable.
 - This customer account is like the "Cash Customer" account used by registers, except that it should be configured for the exclusive use by Fusion POS.
- Payment Type
 - The POS payment type for payments that are made against orders within Fusion POS.
 - This payment type should be created in the POS admin tools and Sage, if applicable.
