OpenID Connect

Menu: Security / OpenID Connect

Feature: OpenID Authorization Server, OpenID Tenant Validation

Editions: Cloud, Corporate, Store

OpenID Connect is the security technology that is used by RMS to validate API and user connections.

- OpenID Token Validation is used to validate API connections to the server.
- OpenID Authorization Server is used to validate Cart App and Order Pad connections to the RMS server. This functionality is typically only enabled for the Cloud tenant.

> You shouldn't normally need to configure this settings page – settings are applied automatically by the Setup Guide.
>
> You can run the Setup Guide at any time to re-apply the default settings. You may wish to do so if there are API connectivity problems, or problems with the Cart App or Order Pad connecting to RMS.
