

Fusion Register

Fusion POS is designed to be installed at corporate and store tenants as an enhancement to the Fusion Register.

a) Corporate Site

For the corporate site, the Register corporate server components should be installed before POS. Installation includes:

- Installation
- Database configuration
- ASI configuration, if applicable
- Communication services
- Configuring lookup, customer and other initial operational data.

b) Store Site

For store sites, the Register store server components should be installed before POS. Installation includes:

- Installation
- Database configuration
- Communication services
- Data exchange for lookup, customer and other initial operational data.

Some single-store deployments may combine corporate and site operations. POS server only need to be deployed once for this scenario.
