

Version 0.10.0

1. 3858: Add email notifications feature. This should be added to installation recipes, but might require some manual configuration when deploying as an upgrade:
 - Enable the Templates feature.
 - In Secure/Settings/Login, enable “Use Site Theme”.
 - In Secure/Settings/Registration, enable “Use Site Theme” and “User must validate email”.
 - In Secure/Settings/Reset Password, enable “Use Site Theme” enable enable the reset password feature.
 - Enable and configure the SMTP feature.
 - You will typically configure this to use the customer’s SMTP server and email address.
 - In SMTP settings, use the “Test Settings” button to test email settings.
2. Upgrade to Orchard RC2
 - Support: .NET Core has been upgraded to 3.1.7. This may require a .NET Core upgrade on all servers.
 - Support: Orchard JWT token validation now performs token type validation (at + jwt). Our licensing server does not yet issue this header. Sync calls and diagnostics will fail by default. In the “Security/OpenID Connect/Settings/Token Validation”, make sure you enable the “Disable token type validation” checkbox to turn this validation off.
 - Dev: this may require an upgrade of your .NET Core SDK to 3.1.7. You may need to delete your bin and obj folders. When deploying, delete the contents of the deployment folder to ensure that the resulting ZIP file contains only the current .NET core version (if not, the ZIP file will be double or triple the size that it should be).
3. Add Nuget.config to solution folder, to specify package sources for the project
 - Dev only; this should just work. You will need to re-load your project however.
4. 4396: Added AWS Core module. See the documentation on how to configure the integration in AWS, as well as the settings required in RMS.
5. 4400: Added AWS S3 module, to store media gallery files on Amazon S3 and optionally use CloudFront to distribute the media files. See the documentation for configuration instructions.
6. Security bug fix
 - removed ‘View all content’ permissions from Authenticated role in RMS_Base recipe

- IMPORTANT: this fix must be applied manually to existing deployments.

7. ~~4450~~: Use customer billing address as default ship address in checkout. Fix bugs related to 'Ship To' selection and updating.
